```
CS 341 Lecture Handout #11
```

#1 Thread of Execution

my process have?

```
int f(int a, int v1,int v2, ...10 more) {
   int b=a+1;
   if(b>99) return 3;
   return b;
}
```

How does return 'work'? i.e. How does the CPU know what to do next?

#2 Introduction to threads and pthreads

```
pthread_create
pthread_join
pthread_exit

#include <pthread.h>
int pthread_create(pthread_t *thread,
    pthread_attr_t *attr,
    void *(*start routine) (void *),
    void *arg);
int pthread_join(pthread_t thread, void **retval);
void pthread_exit(void *retval);

Compile and link with -pthread
```

#3 My program calls pthread create twice. How many stacks does

#4 What is the difference between a process and a thread?
